

In Depth Analysis:

From the dashboard there is a clear difference in performances across not only territories, but product lines, and through different time periods. Among all the regions that we track, EMEA performs the best, sitting around \$4.13 million in total revenue. On the other hand, Japan performs the worst, contributing to roughly about \$364,648 in total sales. While the other two regions, NA and APAC fall in between the two with NA around \$3.18 million sales and APAC on the lower end of the spectrum falling at roughly \$618,000. This large gap in total revenue between EMEA and Japan suggests that there are differences in market demand and sales strategy effectiveness across regions.

In terms of product performance, Classic Cars generated the highest revenue coming in at 36% of total sales made. This makes it the strongest product line overall. Vintage Cars follow Classic Cars at 20%, while Motorcycles and Planes each contribute roughly 11-12% to the overall sales. With Classic Cars dominating the total sales for the product line it shows that there is a higher customer demand for this product making it clear that this product line is a core revenue driver for the business.

Looking at the monthly trends, sales for the most part are generally consistent over time, with a moderate fluctuation across most months. However, there is a very noticeable spike in the later months of 2004, where sales have significantly increased, compared to the surrounding months. This spike could be due to bulk purchasing, large contracts, or even successful promotion of items.

High value orders account for 19% of total orders. While this is a strong proportion of the overall sales, it suggests that the majority of orders being made are smaller in value.

Overall the company should look into the successful sales and marketing strategies used in the higher performing territories such as EMEA or APAC and apply similar approaches to underperforming regions like Japan, or NA to drive overall revenue growth.
