

Dashboard Description

This dashboard provides a comprehensive overview of business performance by combining sales trends, product performance, and profitability analysis. It begins with a time-based view of sales to highlight overall growth patterns, followed by category and sales channel comparisons to identify key revenue drivers. The dashboard also includes a discount impact analysis to examine how pricing strategies influence profitability. Interactive filters for country, segment, sales channel, and date allow users to dynamically explore the data and gain deeper insights across different dimensions.

Final Insights:

The analysis reveals that the business is experiencing steady growth over time, as shown by the upward trend in cumulative sales. However, not all high-performing areas are equally profitable, as some product categories generate strong sales but relatively lower profit, indicating margin inefficiencies. Additionally, the discount analysis shows a clear negative relationship between higher discounts and profitability, with excessive discounting leading to reduced or even negative profit in certain cases. Furthermore, the offline sales channel slightly outperforms the online channel in both revenue and profitability, suggesting it remains a key contributor to overall business performance. Based on these findings, the company should focus on optimizing discount strategies, improving margins in underperforming categories, and strategically investing in the most effective sales channels while sustaining overall growth.
